## **BICYCLIC HETEROAROMATIC DERIVATIVES**

This invention relates to a series of 5-6 fused ring bicyclic heteroaromatic  
5 derivatives, to compositions containing them, to processes for their  
preparation and to their use in medicine.

Immune and inflammatory responses involve a variety of cell types with  
control and co-ordination of the various interactions occurring *via* both cell-  
10 cell contacts (e.g integrin interactions with their receptors) and by way of  
intercellular signalling molecules. A large number of different signalling  
molecules are involved, including cytokines, lymphocytes, chemokines and  
growth factors.

15 Cells respond to such intercellular signalling molecules by means of  
intracellular signalling mechanisms that include protein kinases,  
phosphatases and phospholipases. There are five classes of protein kinase  
of which the major ones are the tyrosine kinases and the serine/threonine  
kinases [Hunter, T., Methods in Enzymology (Protein Kinase Classification)  
20 p. 3, Hunter, T. and Sefton, B.M.; eds. Vol. 200, Academic Press; San Diego,  
1991].

One sub-class of serine/threonine kinases is the mitogen activating protein  
(MAP) kinases of which there are at least three families which differ in the  
25 sequence and size of the activation loop [Adams, J. L. et al, Progress in  
Medicinal Chemistry p. 1-60, King, F. D. and Oxford, A. W.; eds. vol 38,  
Elsevier Science, 2001]: (i) the extracellular regulated kinases (ERKs), (ii) the  
c-Jun NH<sub>2</sub> terminal kinases or stress activated kinases (JNKs or SAP  
kinases) and (iii) the p38 kinases which have a threonine-glycine-tyrosine  
30 (TGY) activation motif. Both the JNKs and p38 MAP kinases are primarily  
activated by stress stimuli including, but not limited to, proinflammatory  
cytokines e.g. tumour necrosis factor (TNF) and interleukin-1 (IL-1),  
ultraviolet light, endotoxin and chemical or osmotic shock.

Four isoforms of p38 have been described (p38 $\alpha$ / $\beta$ / $\gamma$ / $\delta$ ). The human p38 $\alpha$  enzyme was initially identified as a target of cytokine-suppressive anti-inflammatory drugs (CSAIDs) and the two isoenzymes found were initially  
5 termed CSAID binding protein-1 (CSBP-1) and CSBP-2 [Lee, J. C. *et al*, Nature (London) 1994, 372, 739-46]. CSBP-2 is now widely referred to as p38 $\alpha$  and differs from CSBP-1 in an internal sequence of 25 amino acids as a result of differential splicing of two exons that are conserved in both mouse and human [McDonnell, P. C. *et al*, Genomics 1995, 29, 301-2]. CSBP-1 and  
10 p38 $\alpha$  are expressed ubiquitously and there is no difference between the two isoforms with respect to tissue distribution, activation profile, substrate preference or CSAID binding. A second isoform is p38 $\beta$  which has 70% identity with p38 $\alpha$ . A second form of p38 $\beta$  termed p38 $\beta$ 2 is also known and of the two this is believed to be the major form. p38 $\alpha$  and p38 $\beta$ 2 are expressed  
15 in many different tissues. However in monocytes and macrophages p38 $\alpha$  is the predominant kinase activity [Lee, J. C., *ibid*; Jing, Y. *et al*, J. Biol. Chem. 1996, 271, 10531-34; Hale, K. K. *et al*, J. Immun. 1999, 162, 4246-52]. p38 $\gamma$  and p38 $\delta$  (also termed SAP kinase-3 and SAP kinase-4 respectively) have ~63% and ~61% homology to p38 $\alpha$  respectively. p38 $\gamma$  is predominantly  
20 expressed in skeletal muscle whilst p38 $\delta$  is found in testes, pancreas, prostate, small intestine and in certain endocrine tissues.

All p38 homologues and splice variants contain a 12 amino acid activation loop that includes a Thr-Gly-Tyr motif. Dual phosphorylation of both Thr-180  
25 and Tyr-182 in the TGY motif by a dual specificity upstream kinase is essential for the activation of p38 and results in a >1000-fold increase in specific activity of these enzymes [Doza, Y. N. *et al* FEBS Lett., 1995, 364, 7095-8012]. This dual phosphorylation is effected by MKK6 and under certain conditions the related enzyme MKK3 [Enslin, H. *et al* J. Biol. Chem., 1998,  
30 273, 1741-48]. MKK3 and MKK6 belong to a family of enzymes termed

MAPKK (mitogen activating protein kinase kinase) which are in turn activated by MAPKKK (mitogen activating kinase kinase kinase) otherwise known as MAP3K.

- 5 Several MAP3Ks have been identified that are activated by a wide variety of stimuli including environmental stress, inflammatory cytokines and other factors. MEKK4/MTK1 (MAP or ERK kinase kinase/MAP three kinase-1), ASK1 (apoptosis stimulated kinase) and TAK1 (TGF- $\beta$ -activated kinase) are some of the enzymes identified as upstream activators of for MAPKKs.
- 10 MEKK4/MTK1 is thought to be activated by several GADD-45-like genes that are induced in response to environmental stimuli and which eventually lead to p38 activation [Takekawa, M. and Saito, H. Cell, 1998, 95, 521-30]. TAK1 has been shown to activate MKK6 in response to transforming growth factor- $\beta$  (TGF- $\beta$ ). TNF-stimulated activation of p38 is believed to be mediated by the
- 15 recruitment of TRAF2 [TNF receptor associated factor] and the Fas adaptor protein, Daxx, which results in the activation of ASK1 and subsequently p38.

- Several substrates of p38 have been identified including other kinases [e.g. MAPK activated protein kinase 2/3/5 (MAPKAP 2/3/5), p38
- 20 regulated/activated protein kinase (PRAK), MAP kinase-interacting kinase 1/2 (MNK1/2), mitogen- and stress-activated protein kinase 1 (MSK1/RLPK) and ribosomal S6 kinase-B (RSK-B)]; transcription factors [e.g. activating transcription factor 2/6 (ATF2/6), monocyte-enhancer factor-2A/C (MEF2A/C), C/EBP homologous protein (CHOP), Elk1 and Sap-1a1]; and
- 25 other substrates [e.g. cPLA2, p47phox].

- MAPKAP K2 is activated by p38 in response to environmental stress. Mice engineered to lack MAPKAP K2 do not produce TNF in response to lipopolysaccharide (LPS). Production of several other cytokines such as IL-1,
- 30 IL-6, IFN- $\gamma$  and IL-10 is also partially inhibited [Kotlyarov, A. *et al* Nature Cell Biol. 1999, 1, 94-7]. Further, MAPKAP K2 from embryonic stem cells from

p38 $\alpha$  null mice was not activated in response to stress and these cells did not produce IL-6 in response to IL-1 [Allen, M. *et al*, J. Exp. Med. 2000, 191, 859-69]. These results indicate that MAPKAP K2 is not only essential for TNF and IL-1 production but also for signalling induced by cytokines. In addition  
5 MAPKAP K2/3 phosphorylate and thus regulate heat shock proteins HSP 25 and HSP 27 which are involved in cytoskeletal reorganization.

Several small molecule inhibitors of p38 have been reported which inhibit IL-1 and TNF synthesis in human monocytes at concentrations in the low  $\mu$ M  
10 range [Lee, J. C. *et al*, Int. J. Immunopharm. 1988, 10, 835] and exhibit activity in animal models which are refractory to cyclooxygenase inhibitors [Lee, J. C. *et al*, Annals N. Y. Acad. Sci. 1993, 696, 149]. In addition these small molecule inhibitors are known to decrease the synthesis of a wide variety of pro-inflammatory proteins including IL-6, IL-8,  
15 granulocyte/macrophage colony-stimulating factor (GM-CSF) and cyclooxygenase-2 (COX-2). TNF-induced phosphorylation and activation of cytosolic PLA2, TNF-induced expression of VCAM-1 on endothelial cells and IL-1 stimulated synthesis of collagenase and stromelysin are also inhibited by small molecule inhibitors of p38 [Cohen, P. Trends Cell Biol. 1997, 7, 353-  
20 61].

A variety of cells including monocytes and macrophages produce TNF and IL-1. Excessive or unregulated TNF production is implicated in a number of disease states including Crohn's disease, ulcerative colitis, pyresis,  
25 rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis and other arthritic conditions, toxic shock syndrome, endotoxic shock, sepsis, septic shock, gram negative sepsis, bone resorption diseases, reperfusion injury, graft vs. host reaction, allograft rejection, adult respiratory distress syndrome, chronic pulmonary inflammatory disease, silicosis, pulmonary  
30 sarcoisosis, cerebral malaria, scar tissue formation, keloid formation, fever and myalgias due to infection, such as influenza, cachexia secondary to

acquired immune deficiency syndrome (AIDS), cachexia secondary to infection or malignancy, AIDS or AIDS related complex.

Excessive or unregulated IL-1 production has been implicated in rheumatoid  
5 arthritis, osteoarthritis, traumatic arthritis, rubella arthritis, acute synovitis,  
psoriatic arthritis, cachexia, Reiter's syndrome, endotoxemia, toxic shock  
syndrome, tuberculosis, atherosclerosis, muscle degeneration, and other  
acute or chronic inflammatory diseases such as the inflammatory reaction  
induced by endotoxin or inflammatory bowel disease. In addition IL-1 has  
10 been linked to diabetes and pancreatic  $\beta$  cells [Dinarello, C. A. J. Clinical  
Immunology, 1985, 5, 287-97].

IL-8 is a chemotactic factor produced by various cell types including  
endothelial cells, mononuclear cells, fibroblasts and keratinocytes. IL-1, TNF  
15 and LPS all induce the production of IL-8 by endothelial cells. *In vitro* IL-8 has  
been shown to have a number of functions including being a chemoattractant  
for neutrophils, T-lymphocytes and basophils. IL-8 has also been shown to  
increase the surface expression of Mac-1 (CD11b/CD18) on neutrophils  
without *de novo* protein synthesis which may contribute to increased  
20 adhesion of neutrophils to vascular endothelial cells. Many diseases are  
characterised by massive neutrophil infiltration. Histamine release from  
basophils (in both atopic and normal individuals) is induced by IL-8 as is  
lysosomal enzyme release and respiratory burst from neutrophils.

25 The central role of IL-1 and TNF together with other leukocyte derived  
cytokines as important and critical inflammatory mediators is well  
documented. The inhibition of these cytokines has been shown or would be  
expected to be of benefit in controlling, alleviating or reducing many of these  
disease states.

30

The central position that p38 occupies within the cascade of signalling molecules mediating extracellular to intracellular signalling and its influence over not only IL-1, TNF and IL-8 production but also the synthesis and/or action of other pro-inflammatory proteins (e.g. IL-6, GM-CSF, COX-2, collagenase and stromelysin) make it an attractive target for inhibition by small molecule inhibitors with the expectation that such inhibition would be a highly effective mechanism for regulating the excessive and destructive activation of the immune system. Such an expectation is supported by the potent and diverse anti-inflammatory activities described for p38 kinase inhibitors [Adams, *ibid*; Badger, *et al*, J. Pharm. Exp. Ther. 1996, 279, 1453-61; Griswold, *et al*, Pharmacol. Comm., 1996, 7, 323-29].

We have now found a group of compounds which are potent and selective inhibitors of p38 kinase (p38 $\alpha$ ,  $\beta$ ,  $\delta$  and  $\gamma$ ) and the isoforms and splice variants thereof, especially p38 $\alpha$ , p38 $\beta$  and p38 $\beta$ 2. The compounds are thus of use in medicine, for example in the prophylaxis and treatment of immune or inflammatory disorders as described herein.

- 25
- 30 When in the group  $-L^6Alk^5(R^{10a})_r$ ,  $r$  is an integer 1, 2 or 3, it is to be understood that the substituent or substituents  $R^{10a}$  may be present on any suitable carbon

atom in  $-\text{Alk}^5$ . Where more than one  $\text{R}^{10a}$  substituent is present these may be the same or different and may be present on the same or different atom in  $-\text{Alk}^5$ . Clearly, when  $r$  is zero and no substituent  $\text{R}^{10a}$  is present the alkylene, alkenylene or alkynylene chain represented by  $\text{Alk}^5$  becomes an alkyl, alkenyl or alkynyl group.

When  $\text{R}^{10a}$  is a substituted amino group it may be for example a group  $-\text{NHR}^{11}$  [where  $\text{R}^{11}$  is as defined above] or a group  $-\text{N}(\text{R}^{11})_2$  wherein each  $\text{R}^{11}$  group is the same or different.

 5  $\text{CH}_2\text{CH}_2\text{CH}=\text{CH}_2-$ ,  $-\text{CC}-$ ,  $-\text{CCCH}_2-$ ,  $-\text{CH}_2\text{CC}-$ ,  $-\text{CCCH}_2\text{CH}_2-$ ,  $-\text{CH}_2\text{CCCH}_2-$  or  $-\text{CH}_2\text{CH}_2\text{CC}-$  chain, optionally interrupted by one, two, or three  $-\text{O}-$  or  $-\text{S}-$ , atoms or  $-\text{S}(\text{O})-$ ,  $-\text{S}(\text{O})_2-$  or  $-\text{N}(\text{R}^{12})-$ , e.g.  $-\text{N}(\text{CH}_3)-$  groups. The aliphatic chains represented by  $\text{Alk}^5$  may be optionally substituted by one, two or three halogen atoms in addition to any  $\text{R}^{10a}$  groups that may be present.

10

Aryl or heteroaryl groups represented by the groups  $\text{R}^{10a}$  or  $\text{R}^{11}$  include mono- or bicyclic optionally substituted  $\text{C}_{6-12}$  aromatic or  $\text{C}_{1-9}$  heteroaromatic groups as described above for the group  $\text{Cy}^1$ . The aromatic and heteroaromatic groups may be attached to the group  $\text{Cy}^1$  in compounds of formula (1) by any carbon   
 15 or hetero e.g. nitrogen atom as appropriate.

It will be appreciated that when  $-\text{NHet}^1$  or  $-\text{Het}$  forms part of a substituent  $\text{R}^{10}$  the heteroatoms or heteroatom containing groups that may be present within the ring  $-\text{NHet}^1$  or  $-\text{Het}$  take the place of carbon atoms within the parent carbocyclic   
 20 ring.

Thus when  $-\text{NHet}^1$  or  $-\text{Het}$  forms part of a substituent  $\text{R}^{10}$  each may be for example an optionally substituted pyrrolidinyl, imidazolidinyl, pyrazolidinyl, piperazinyl, morpholinyl, thiomorpholinyl, piperidinyl or thiazolidinyl group.   
 25 Additionally  $\text{Het}$  may represent for example, an optionally substituted cyclopentyl or cyclohexyl group. Optional substituents which may be present on  $-\text{NHet}^1$  include those substituents described above when  $\text{Cy}^1$  is a heterocycloaliphatic group.

- 15 Particularly useful compounds of the invention include each of the compounds described in the Examples hereinafter, and the salts, solvates, hydrates and N-oxides thereof.
- Compounds according to the invention are potent and selective inhibitors of
- 20 p38 kinases, including all isoforms and splice variants thereof. More specifically the compounds of the invention are inhibitors of p38α, p38β and p38β2. The ability of the compounds to act in this way may be simply determined by employing tests such as those described in the Examples hereinafter.
- 25
- The compounds of formula (1) are of use in modulating the activity of p38 kinases and in particular are of use in the prophylaxis and treatment of any p38 kinase mediated diseases or disorders in a human, or other mammal. The invention extends to such a use and to the use of the compounds for the
- 30 manufacture of a medicament for treating such diseases or disorders. Further

the invention extends to the administration to a human an effective amount of a p38 inhibitor for treating any such disease or disorder.

5 The invention also extends to the prophylaxis or treatment of any disease or disorder in which p38 kinase plays a role including conditions caused by excessive or unregulated pro-inflammatory cytokine production including for example excessive or unregulated TNF, IL-1, IL-6 and IL-8 production in a human, or other mammal. The invention extends to such a use and to the use of the compounds for the manufacture of a medicament for treating such  
10 cytokine-mediated diseases or disorders. Further the invention extends to the administration to a human an effective amount of a p38 inhibitor for treating any such disease or disorder.

15 Diseases or disorders in which p38 kinase plays a role either directly or via pro-inflammatory cytokines including the cytokines TNF, IL-1, IL-6 and IL-8 include without limitation autoimmune diseases, inflammatory diseases, destructive-bone disorders, proliferative disorders, neurodegenerative disorders, viral diseases, allergies, infectious diseases, heart attacks, angiogenic disorders, reperfusion/ischemia in stroke, vascular hyperplasia,  
20 organ hypoxia, cardiac hypertrophy, thrombin-induced platelet aggregation and conditions associated with prostaglandin endoperoxidase synthetase-2 (COX-2).

Autoimmune diseases which may be prevented or treated include but are not  
25 limited to rheumatoid arthritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, multiple sclerosis, diabetes, glomerulonephritis, systemic lupus erythematosus, scleroderma, chronic thyroiditis, Grave's disease, hemolytic anemia, autoimmune gastritis, autoimmune neutropenia, thrombocytopenia, chronic active hepatitis, myasthenia gravis, atopic  
30 dermatitis, graft vs, host disease or psoriasis.

The invention further extends to the particular autoimmune disease rheumatoid arthritis.

Inflammatory diseases which may be prevented or treated include but are not  
5 limited to asthma, allergies, respiratory distress syndrome or acute or chronic pancreatitis.

Destructive bone disorders which may be prevented or treated include but  
are not limited to osteoporosis, osteoarthritis and multiple myeloma-related  
10 bone disorder.

Proliferative diseases which may be prevented or treated include but are not  
limited to acute or chronic myelogenous leukemia, Kaposi's sarcoma,  
metastatic melanoma and multiple myeloma.  
15

Neurodegenerative diseases which may be prevented or treated include but  
are not limited to Parkinson's disease, Alzheimer's disease, cerebral  
ischemias or neurodegenerative disease caused by traumatic injury.

20 Viral diseases which may be prevented or treated include but are not limited  
to acute hepatitis infection (including hepatitis A, hepatitis B and hepatitis C),  
HIV infection and CMV retinitis.

Infectious diseases which may be prevented or treated include but are not  
25 limited to septic shock, sepsis and Shigellosis.

In addition, p38 inhibitors of this invention also exhibit inhibition of expression  
of inducible pro-inflammatory proteins such as prostaglandin endoperoxidase  
synthetase-2, otherwise known as cyclooxygenase-2 (COX-2) and are  
30 therefore of use in therapy. Pro-inflammatory mediators of the  
cyclooxygenase pathway derived from arachidonic acid are produced by

inducible COX-2 enzyme. Regulation of COX-2 would regulate these pro-inflammatory mediators such as prostaglandins, which affect a wide variety of cells and are important and critical inflammatory mediators of a wide variety of disease states and conditions. In particular these inflammatory mediators  
5 have been implicated in pain, such as in the sensitization of pain receptors, or edema. Accordingly additional p38 mediated conditions which may be prevented or treated include edema, analgesia, fever and pain such as neuromuscular pain, headache, dental pain, arthritis pain and pain caused by cancer.

10

As a result of their p38 inhibitory activity, compounds of the invention have utility in the prevention and treatment of diseases associated with cytokine production including but not limited to those diseases associated with TNF, IL-1, IL-6 and IL-8 production.

15

Thus TNF mediated diseases or conditions include for example rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis and other arthritic conditions, sepsis, septic shock syndrome, adult respiratory distress syndrome, cerebral malaria, chronic pulmonary inflammatory disease,  
20 silicosis, pulmonary sarcoiiosis, bone resorption disease, reperfusion injury, graft vs. host reaction, allograft rejections, fever and myalgias due to infection, cachexia secondary to infection, AIDS, ARC or malignancy, keloid formation, scar tissue formation, Crohn's disease, ulcerative colitis, pyresis, viral infections such as HIV, CMV, influenza and herpes; and veterinary viral  
25 infections, such as lentivirus infections, including but not limited to equine infectious anemia virus, caprine arthritis virus, visna virus or maedi virus; or retrovirus infections, including feline immunodeficiency virus, bovine immunodeficiency virus or canine immunodeficiency virus.

30 Compounds of the invention may also be used in the treatment of viral infections, where such viruses elicit TNF production *in vivo* or are sensitive to

upregulation by TNF. Such viruses include those that produce TNF as a result of infection and those that are sensitive to inhibition, for instance as a result of decreased replication, directly or indirectly by the TNF inhibiting compounds of the invention. Such viruses include, but are not limited to, HIV-1, HIV-2 and HIV-3, Cytomegalovirus (CMV), Influenza, adenovirus and the Herpes group of viruses such as Herpes Zoster and Herpes Simplex.

IL-1 mediated diseases or conditions include for example rheumatoid arthritis, osteoarthritis, psoriatic arthritis, traumatic arthritis, rubella arthritis, inflammatory bowel disease, stroke, endotoxemia and/or toxic shock syndrome, inflammatory reaction induced by endotoxin, diabetes, pancreatic  $\beta$ -cell disease, Alzheimer's disease, tuberculosis, atherosclerosis, muscle degeneration and cachexia.

IL-8 mediated diseases and conditions include for example those characterized by massive neutrophil infiltration such as psoriasis, inflammatory bowel disease, asthma, cardiac, brain and renal reperfusion injury, adult respiratory distress syndrome, thrombosis and glomerulonephritis. The increased IL-8 production associated with each of these diseases is responsible for the chemotaxis of neutrophils into inflammatory sites. This is due to the unique property of IL-8 (in comparison to TNF, IL-1 and IL-6) of promoting neutrophil chemotaxis and activation. Therefore, inhibition of IL-8 production would lead to a direct reduction in neutrophil infiltration.

25

It is also known that both IL-6 and IL-8 are produced during rhinovirus (HRV) infections and contribute to the pathogenesis of the common cold and exacerbation of asthma associated with HRV infection [Turner *et al*, Clin. Infect. Dis., 1997, 26, 840; Grunberg *et al*, Am. J. Crit. Care Med. 1997, 155, 1362; Zhu *et al*, J. Clin. Invest. 1996, 97, 421]. It has also been demonstrated *in vitro* that infection of pulmonary epithelial cells (which represent the

primary site of infection by HRV) with HRV results in production of IL-6 and IL-8 [Sabauste *et al*, J. Clin. Invest. 1995, 96, 549]. Therefore, p38 inhibitors of the invention may be used for the treatment or prophylaxis of the common cold or respiratory viral infection caused by human rhinovirus infection (HRV),  
5 other enteroviruses, coronavirus, influenza virus, parainfluenza virus, respiratory syncytial virus or adenovirus infection.

For the prophylaxis or treatment of a p38 or pro-inflammatory cytokine mediated disease the compounds according to the invention may be  
10 administered to a human or mammal as pharmaceutical compositions, and according to a further aspect of the invention we provide a pharmaceutical composition which comprises a compound of formula (1) together with one or more pharmaceutically acceptable carriers, excipients or diluents.

15 Pharmaceutical compositions according to the invention may take a form suitable for oral, buccal, parenteral, nasal, topical, ophthalmic or rectal administration, or a form suitable for administration by inhalation or insufflation.

20 For oral administration, the pharmaceutical compositions may take the form of, for example, tablets, lozenges or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g. lactose, microcrystalline cellulose or calcium  
25 hydrogen phosphate); lubricants (e.g. magnesium stearate, talc or silica); disintegrants (e.g. potato starch or sodium glycollate); or wetting agents (e.g. sodium lauryl sulphate). The tablets may be coated by methods well known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a  
30 dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may be prepared by conventional means with

pharmaceutically acceptable additives such as suspending agents, emulsifying agents, non-aqueous vehicles and preservatives. The preparations may also contain buffer salts, flavouring, colouring and sweetening agents as appropriate.

5

Preparations for oral administration may be suitably formulated to give controlled release of the active compound.

For buccal administration the compositions may take the form of tablets or  
10 lozenges formulated in conventional manner.

The compounds for formula (1) may be formulated for parenteral administration by injection e.g. by bolus injection or infusion. Formulations for injection may be presented in unit dosage form, e.g. in glass ampoule or  
15 multi dose containers, e.g. glass vials. The compositions for injection may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilising, preserving and/or dispersing agents. Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, e.g.  
20 sterile pyrogen-free water, before use.

In addition to the formulations described above, the compounds of formula (1) may also be formulated as a depot preparation. Such long acting formulations may be administered by implantation or by intramuscular  
25 injection.

For nasal administration or administration by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of an aerosol spray presentation for pressurised packs or a nebuliser, with  
30 the use of suitable propellant, e.g. dichlorodifluoromethane, trichloro-

fluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas or mixture of gases.

The compositions may, if desired, be presented in a pack or dispenser device  
5 which may contain one or more unit dosage forms containing the active ingredient. The pack or dispensing device may be accompanied by instructions for administration.

For topical administration the compounds for use according to the present  
10 invention may be conveniently formulated in a suitable ointment containing the active component suspended or dissolved in one or more pharmaceutically acceptable carriers. Particular carriers include, for example, mineral oil, liquid petroleum, propylene glycol, polyoxyethylene, polyoxypropylene, emulsifying wax and water. Alternatively the compounds  
15 for use according to the present invention may be formulated in a suitable lotion containing the active component suspended or dissolved in one or more pharmaceutically acceptable carriers. Particular carriers include, for example mineral oil, sorbitan monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, benzyl alcohol, 2-octyldodecanol and water.

20

For ophthalmic administration the compounds for use according to the present invention may be conveniently formulated as microionized suspensions in isotonic, pH adjusted sterile saline, either with or without a preservative such as bactericidal or fungicidal agent, for example  
25 phenylmercuric nitrate, benzylalkonium chloride or chlorhexidine acetate. Alternatively for ophthalmic administration compounds may be formulated in an ointment such as petrolatum.

For rectal administration the compounds for use according to the present  
30 invention may be conveniently formulated as suppositories. These can be prepared by mixing the active component with a suitable non-irritating

excipient which is solid at room temperature but liquid at rectal temperature and so will melt in the rectum to release the active component. Such materials include for example cocoa butter, beeswax and polyethylene glycols.

5

The quantity of a compound of the invention required for the prophylaxis or treatment of a particular condition will vary depending on the compound chosen, and the condition of the patient to be treated. In general, however, daily dosages may range from around 100ng/kg to 100mg/kg e.g. around  
10 0.01mg/kg to 40mg/kg body weight for oral or buccal administration, from around 10ng/kg to 50mg/kg body weight for parenteral administration and around 0.05mg to around 1000mg e.g. around 0.5mg to around 1000mg for nasal administration or administration by inhalation or insufflation.

15 The compounds of the invention may be prepared by a number of processes as generally described below and more specifically in the Examples hereinafter. In the following process description, the symbols Ar, Cy<sup>1</sup>, Alk<sup>1</sup>, n, L<sup>1</sup>, R, R<sup>a</sup>, R<sup>b</sup>, R<sup>c</sup>, A, X and Y when used in the formulae depicted are to be understood to represent those groups described above in relation to formulae  
20 (1a) and (1b) unless otherwise indicated. In the reactions described below, it may be necessary to protect reactive functional groups, for example hydroxy, amino, thio or carboxy groups, where these are desired in the final product, to avoid their unwanted participation in the reactions. Conventional protecting groups may be used in accordance with standard practice [see, for example,  
25 Green, T. W. in "Protective Groups in Organic Synthesis", John Wiley and Sons, 1999]. In some instances, deprotection may be the final step in the synthesis of a compound of formula (1) and the processes according to the invention described hereinafter are to be understood to extend to such removal of protecting groups.

30

Thus according to a further aspect of the invention a compound of formula (1) in which A is a  $-C(R^b)=$  group, X is a  $-O-$  or  $-S-$  atom or  $-NH-$  group and Y is a substituted carbon atom in which the substituent is an esterified carboxyl group, for example a  $-CO_2Alk^6$  group, may be prepared according to the reactions set out in Scheme 1 below. In the Scheme the preparation of an ethyl ester is specifically shown, but it will be appreciated that other esters may be obtained by simply varying the ester starting material and if appropriate any reaction conditions:

10

15

20

Scheme 1

Thus in Scheme 1 a compound of formula (1) may be prepared by reaction of a compound of formulae (2) or (3) with an amine  $\text{ArNH}_2$  in the presence of a palladium catalyst. The reaction may be conveniently carried out in a solvent such as toluene at an elevated temperature, eg the reflux temperature, using a catalyst such as tris(dibenzylideneacetone)dipalladium(0), a phosphine ligand such as 2,2'-bis(diphenylphosphino)-1,1'-binaphthyl and a base such as caesium carbonate. Where desired, alternative reaction conditions may be used, for example as described in the literature [Luker et al. Tet. Lett. (2001) 41, 7731; Buchwald S.L. J.Org.Chem. (2000) 65 1144; Hartwig J.F. Angew. Chem. Int. Ed. Engl. (1998) 37, 2046].

Intermediates of formula (2) may be prepared by reaction of a compound of formula (4) with an alkylating agent of formula  $\text{Cy}^1\text{L}^1(\text{Alk}^1)_n\text{Z}$ , where Z is a

leaving group such as a halogen atom, e.g. a chlorine, bromine or iodine atom or a sulphonyloxy group such as an alkylsulphonyloxy e.g. trifluoromethylsulphonyloxy or arylsulphonyloxy e.g. phenylsulphonyloxy group.

5

The reaction may be performed in the presence of a solvent, for example a substituted amide such as dimethylformamide, optionally in the presence of a base, for example an inorganic base such as sodium hydride, or an organic base such as an organic amine, e.g. a cyclic amine such as 1,5-diazabicyclo[4.3.0]non-5-ene or a resin bound organic amine such as resin bound 2-*tert*-butylimino-2-diethylamino-1,3-dimethyl-perhydro-1,3,2-diazaphosphorine (PS-BEMP), at an elevated temperature, for example 80 to 100°C.

10

15

Intermediates of formula (3) may be prepared by the reaction of a compound of formula (4) with a boronic acid of formula  $Cy^1B(OH)_2$  in which  $Cy^1$  is an aryl or heteroaryl group. The reaction may be performed in an organic solvent, for example a halogenated hydrocarbon such as dichloromethane or dichloroethane in the presence of a copper reagent, for example a copper (I) salt such as CuI or for example a copper (II) reagent such as copper (II) acetate, optionally in the presence of an oxidant, for example 2,2,6,6-tetramethylpiperidine-1-oxide or pyridine-N-oxide, optionally in the presence of a base, for example an organic amine such as an alkylamine, e.g. triethylamine or an aromatic amine, e.g. pyridine at a temperature from around ambient to the reflux temperature [see for example Chan, D.T. *et al* Tetrahedron Letters, 1998, 2933; Lam, P.Y.S. *et al*, Tetrahedron Letters, 2001, 3415]

20

25

Intermediates of formula (3) where  $Cy^1$  is an aryl or heteroaryl group may also be prepared by nucleophilic aromatic substitution of a suitably activated aryl or heteroaryl halide with a compound of formula (4). The reaction may be

30

performed in a dialkylamide solvent such as dimethylformamide in the presence of a base such as a metal hydride e.g. sodium hydride at a temperature from around ambient to 100°C. Suitably activated aryl or heteroaryl halides are those with an electron withdrawing substituent such as a nitro, cyano or ester group e.g. a chloro- or fluoro-nitrobenzene or 2-chloro-5-nitropyridine. Alternatively a nitrogen containing heteroaryl halide can be activated to nucleophilic substitution by N-oxidation for example a halopyridine N-oxide such as a chloropyridine N-oxide e.g. 2-chloropyridine N-oxide.

10

It will be appreciated that if desired the reactions just described may be carried out in the reverse order so that the amination using  $\text{ArNH}_2$  is performed first with the intermediate of formula (4) followed by alkylation/arylation to yield the compound of formula (1). It may be necessary to protect the nitrogen function of compounds of formula (4) during the course of these reactions. Such protection may be achieved by O-alkylation with an alkyl halide e.g. cyclopropylmethyl bromide or an arylalkyl bromide e.g. benzyl bromide as shown in Scheme 1a.

Scheme 1a

20

The O-alkylation reaction may be performed in an organic solvent such as dimethylformamide in the presence of a base, for example an inorganic base

such as  $\text{Cs}_2\text{CO}_3$  or an organic base such as an amine e.g. a cyclic amine such as 1,5-diazabicyclo[4.3.0]non-5-ene at an elevated temperature e.g.  $80^\circ\text{C}$  to  $100^\circ\text{C}$  to give a compound of formula (13). Reaction of the protected compound (13) with  $\text{ArNH}_2$  under palladium catalysis can then be performed  
5 as previously described to give a compound of formula (14). Deprotection can then be achieved by treating a solution of this compound in an alcohol e.g. methanol with a mineral acid such as concentrated  $\text{HCl}$  at an elevated temperature e.g. the reflux temperature to give a compound of formula (15). Alternatively when benzyl protection is employed then this group may be  
10 removed reductively by treating a solution of compound (14) in a solvent e.g. water or an organic solvent such as ethanol using a palladium or platinum catalyst e.g. palladium on carbon or  $\text{PtO}_2$  under an elevated pressure of hydrogen at a temperature from around ambient to  $60^\circ\text{C}$ . Compounds of formula (15) can then undergo alkylation/arylation reactions as previously  
15 described to give compounds of formula (1).

Intermediate pyridinones of formula (4) may be prepared from pyridine N-oxides of formula (5) by sequential reaction with an anhydride, for example acetic anhydride at an elevated temperature, for example the reflux  
20 temperature followed by reaction with an inorganic base, for example a carbonate such as aqueous potassium carbonate in a solvent such as an ether for example a cyclic ether e.g. tetrahydrofuran at around ambient temperature. Alternatively the reaction may be performed using trifluoroacetic anhydride in dimethylformamide from  $0^\circ\text{C}$  to ambient temperature conditions  
25 [see for example Konno et al., Heterocycles (1986) 24, 2169].

Pyridine N-oxides of formula (5) may be formed by oxidation of pyridines of formula (6) using an oxidising agent such as hydrogen peroxide in the presence of an acid such as acetic acid, at an elevated temperature, for  
30 example around  $70^\circ\text{C}$  to  $80^\circ\text{C}$ , or alternatively by reaction with a peracid such as peracetic acid or m-chloroperoxybenzoic acid in a solvent, such as a

halogenated hydrocarbon e.g. dichloromethane or an alcohol e.g. tert-butanol at a temperature from the ambient temperature to the reflux temperature.

Intermediate pyridines of formula (6) in Scheme 1 may be obtained by standard methods such as for example by the Sandmeyer reaction. Thus for example a bromide of formula (6) may be prepared by treatment of an aryl amine of formula (7) with an alkyl nitrite, for example t-butyl nitrite and a copper salt, for example copper (II) bromide in the presence of a solvent, for example a nitrile such as acetonitrile at a temperature from about 0° to around 65°C.

Amines of formula (7) may be formed from 2-halopyridine-3-carbonitriles of formula (8) by reaction with a reagent of formula  $\text{HXCH}_2\text{CO}_2\text{Et}$  [where Et is an ethyl group and X is a -O- or -S- atom or -NH- group]. The reaction may be performed in the presence of a solvent such as a substituted amide for example dimethylformamide or an ether e.g. a cyclic ether such as tetrahydrofuran or alcohol such as ethanol in the presence of a base, for example an inorganic base such as sodium carbonate or a hydride e.g. sodium hydride or an organic base such as 1,5-diazabicyclo[4.3.0]non-5-ene or a trialkylamine such as triethylamine at a temperature between about 0°C and 100°C. The carbonitrile starting materials are readily available or may be obtained from known compounds using standard procedures.

In another process according to the invention, a compound of formula (1) in which A is a  $-\text{C}(\text{R}^b)=$  group, X is a -O- or -S- atom or -NH- group and Y is a  $-\text{C}(\text{CN})=$  group may be prepared using the reactions set out in Scheme 2 below:

#### Scheme 2

30

- Thus in Scheme 2, a 2-cyano intermediate of formula (9) may be aminated and alkylated or arylated in a final step to yield a compound of the invention using the reactions and reagents described above in relation to the amination, alkylation and arylation of intermediates of formula (4). Nitriles of formula (9) may be obtained by dehydration of the corresponding amide of formula (10) using a dehydrating agent such as trifluoroacetic anhydride in the presence of a base such as pyridine in a solvent, for example a halogenated hydrocarbon such as dichloromethane at around ambient temperature. Alternatively, cyanuric chloride may be used in a solvent such as dimethylformamide at a temperature from around 0°C to 110°C. Amides of formula (10) may be obtained from the corresponding acids of formula (11) using conventional procedures, for example by reaction with 1,1'-carbonyldiimidazole and aqueous ammonia in a solvent such as dimethylformamide at ambient temperature. The intermediate acids of formula (11) may be prepared by hydrolysis of esters of formula (4) using a base such as lithium hydroxide in water and a solvent such as tetrahydrofuran.
- In another process according to the invention, a compound of formula (1) in which A is a  $-C(R^b)=$  group, X is a  $-O-$  or  $-S-$  atom, Y is a  $-C(CN)=$  group,

Ar is a heteroaromatic group and Alk<sup>1</sup>, L, n and Cy<sup>1</sup> are as previously defined, may be prepared by nucleophilic aromatic substitution of a suitably activated heteroaryl halide with a compound of formula (16). This reaction can be performed in an organic solvent such as an ether, e.g. tetrahydrofuran or dialkylamide e.g. dimethylformamide or a solvent such as dimethylsulphoxide in the presence of an inorganic base such as sodium hydride at an elevated temperature from 50-80°C. Suitably activated heteroaryl halides include halopyridines e.g. a chloropyridine such as 2,6-dichloropyridine or halopyridine N-oxides e.g. a chloropyridine N-oxide such as 2-chloro-6-methylpyridine N-oxide.

Amides of formula (1a) may be obtained from acids of formula (17) using conventional procedures such as those described in Scheme (4).

#### 15 Scheme 4

Thus amides may be formed by reaction of the acid (17) with 1,1'-carbonyldiimidazole and an amine of formula HNR<sup>15</sup>R<sup>15</sup> (where each R<sup>15</sup> is independently H or R<sup>11</sup> as previously described) or aqueous ammonia in a solvent e.g. an amide solvent such as dimethylformamide at around ambient

- temperature to 60°C. Alternatively the acid may be reacted with an activating agent such as a carbodiimide e.g. 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide or N,N'-dicyclohexylcarbodiimide and the amine  $\text{HNR}^{15}\text{R}^{15}$  optionally in the presence of a base such as an amine e.g. triethylamine or N-methylmorpholine in a solvent such as dimethylformamide or an ether e.g. tetrahydrofuran or a halogenated hydrocarbon, e.g. dichloromethane at around ambient temperature to the reflux temperature. In another procedure reaction of an acid of formula (17) with 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide and pentafluorophenol in a solvent such as an amide solvent e.g. DMF at around ambient temperature affords a pentafluorophenyl ester of formula (18). Amides of formula (1a) can then be prepared by reaction of this ester with amines of formula  $\text{HNR}^{15}\text{R}^{15}$  or aqueous ammonia in a solvent such as a halogenated hydrocarbon e.g. dichloromethane at around ambient temperature. The intermediate acids of formula (17) may be prepared by hydrolysis of esters of formula (1) described in Scheme 1 using a base such as an alkali metal hydroxide e.g. sodium hydroxide or lithium hydroxide in water and a solvent such as tetrahydrofuran or alcohol such as ethanol from around ambient temperature to the reflux temperature.
- Amides of formula (1a) can also be prepared directly from esters of formula (1) described in Scheme 1 by heating with an amine of formula  $\text{HNR}^{15}\text{R}^{15}$  up to the reflux temperature of that amine either at atmospheric pressure or under pressure in a sealed tube. Carboxamides of formula (1b) in which X is a -O- or -S- atom and Y is a  $-\text{C}(\text{CONH}_2)=$  group, and where A, Ar,  $\text{Alk}^1$ , L, n and  $\text{Cy}^1$  are as previously defined may also be prepared by reaction of an ester of formula (1) with liquid ammonia in a solvent such as 2-ethoxyethanol at elevated pressure (200-400 psi) in a Parr pressure vessel and temperature between 60-120°C. In another process carboxamides of formula (1b) as described above could also be prepared by hydrolysis of a nitrile of formula (1c) with a base such as an alkali metal hydroxide e.g. sodium hydroxide or

potassium hydroxide in water with a solvent such as an alcohol e.g. ethanol at a temperature from around ambient up to the reflux temperature.

5

In another process compounds of formula (1) in which A is a  $-\text{C}(\text{H})=$  group,  $\text{R}^a$  is H, X is a  $-\text{S}-$  atom, Y is a  $-\text{C}(\text{CR}^{10a})=$  group where  $\text{R}^{10a}$  is a  $-\text{CN}$ ,  $-\text{NO}_2$ ,  $-\text{CONH}_2$ ,  $-\text{CONHR}^{11}$ ,  $-\text{CON}(\text{R}^{11})_2$ ,  $-\text{COR}^{11}$  or  $-\text{CO}_2\text{Alk}^6$  group, L is a covalent bond,  $n=0$  and  $\text{Cy}_1$ ,  $\text{R}^{11}$ ,  $\text{Alk}^6$  and Ar are as previously defined may be

10 prepared by the reactions set out in Scheme 5.

#### Scheme 5

Thus in step (A) of the reaction scheme a compound of formulae (19) or (20), where Rx is an optionally substituted alkyl group e.g. methyl and W is a  
 15 hydrogen atom metal ion or amine salt, may be reacted with a thioamide of formula (21). The reaction may be performed in the presence of a base. Appropriate bases may include, but are not limited to, lithium bases such as n-butyl or t-butyl lithium or lithium diisopropylamide (LDA), or silazanes e.g. lithium hexamethyldisilazane (LiHMDS) or sodium hexamethyldisilazane  
 20 (NaHMDS), or a carbonate, e.g. potassium carbonate, an alkoxide, e.g. sodium ethoxide, sodium methoxide, potassium t-butoxide, a hydroxide e.g.

NaOH or a hydride, e.g. sodium hydride, or an organic amine e.g. triethylamine or N,N-diisopropylethylamine or a cyclic amine, such as N-methylmorpholine or pyridine. The reaction may be performed in an organic solvent such as an amide e.g. a substituted amide such as  
5 dimethylformamide, an ether e.g. a cyclic ether such as tetrahydrofuran or dioxane or an alcohol e.g. methanol, ethanol or propanol or acetonitrile, at a temperature from ambient to the reflux temperature. In one particular aspect of the process the reaction is achieved using an alkoxide base, especially sodium ethoxide or sodium methoxide in an alcoholic solvent, especially  
10 ethanol at reflux temperature.

Intermediates of formula (19), where not commercially available, may be prepared using standard methodology. (See, for example, Mir Hedayatullah, J. Heterocyclic Chem., 18, 339, (1981)). Similarly, intermediates of formula  
15 (20) where not commercially available, may be prepared using standard methodology. For example they may be prepared *in-situ* by reaction of an acetate e.g. ethyl acetate with a base such as sodium methoxide followed by addition of a formate e.g. methyl formate.

20 In a similar manner, Intermediates of formula (21), if not commercially available, may be prepared using methods known to those skilled in the art (see, for example Adhikari et al, Aust. J. Chem., 52, 63-67, (1999)). For example, an isothiocyanate of formula  $Cy^1NCS$  may be reacted with acetonitrile in the presence of a base e.g. NaHMDS in a suitable solvent e.g.  
25 tetrahydrofuran, optionally at a low temperature, e.g. around  $-78^{\circ}C$ . According to the nature of the group  $Cy^1$ , the Intermediate of formula (21) may be prepared *in situ*, for example, using the methods as described herein, followed by subsequent addition of a compound of formulae (19) or (20).

30 During the course of this process an intermediate of formula (22) may be formed. If desired the intermediate may be isolated at the end of step (A) and

subsequently reacted with intermediate (23) to form the desired amine (24). In some instances however it may be advantageous not to isolate the intermediate of formula (22) and reaction (B) may be carried out directly with the reaction mixture of step (A).

5

If a different solvent is used during the second stage of the process, it may be necessary to evaporate the solvent, *in vacuo*, from the first stage of the process before proceeding with the second stage. Once evaporated, the crude solids from step (A) may be used in the next stage or they may be purified, for example, by crystallisation, to yield an isolated intermediate, such as a compound of formula (22).

During step (B) of the process an intermediate of formula (23) may then be added to the reaction mixture or to the crude solids or purified product from step (A) in a suitable solvent. Suitable solvents include, but are not limited to, amides e.g. a substituted amide such as dimethylformamide, alcohols e.g. ethanol, methanol or isopropyl alcohol, ethers e.g. a cyclic ether such as tetrahydrofuran or dioxane or acetonitrile. The reaction may be performed at a temperature from ambient up to the reflux temperature.

20

During the course of step (B) an intermediate of formula (26):

may be observed or even isolated, depending upon the nature of the group R. The intermediate of formula (26) may be converted to a compound of formula (24) using the methods described above. In this situation it may be necessary to add a base, in order for the reaction to proceed to completion. Appropriate bases include carbonates e.g. caesium or potassium carbonate,

25

or alkoxides e.g. potassium *t*-butoxide, or hydrides e.g. sodium hydride or organic amines e.g. triethylamine or *N,N*-diisopropylethylamine or cyclic amines, such as *N*-methylmorpholine or pyridine.

- 5 Amines of formula (24) can be converted to bromides of formula (25) by standard methods such as for example by the Sandmeyer reaction as previously described for compounds of formula (7). Compounds of formula (1) can then be prepared from these bromides by the palladium catalysed amination reactions already described.

10

- It will be appreciated that Intermediates of formula (23) where not commercially available may be prepared using standard methods known to those skilled in the art. For example, alcohol groups may be converted into leaving groups, such as halogen atoms or sulfonyloxy groups using conditions known to the skilled artisan. For example, an alcohol may be reacted with thionyl chloride in a halogenated hydrocarbon e.g., dichloromethane to yield the corresponding chloride. A base e.g., triethylamine may also be used in the reaction.

- 20 It will be appreciated that intermediates, such as intermediates (19), (20), (21) or (23), if not available commercially, may also be prepared by methods known to those skilled in the art following procedures set forth in references such as Rodd's Chemistry of Carbon Compounds, Volumes 1-15 and Supplementals (Elsevier Science Publishers, 1989), Fieser and Fieser's Reagents for Organic Synthesis, Volumes 1-19 (John Wiley and Sons, 1999), Comprehensive Heterocyclic Chemistry, Ed. Comprehensive Organic Transformations (VCH Publishers Inc., 1989) and March's Advanced Organic Chemistry (John Wiley and Sons, 1992).

According to a further aspect of the invention a compound of formula (1) in which X is an -S- atom and Y is a  $-C(S(O)_2NR^{16})=$  group (where each  $R^{16}$  substituent is independently H or  $R^{11}$  as previously defined) may be prepared by the route set out in Scheme 6.

#### Scheme 6

Thus a compound of formula (28) can be obtained by reaction of a compound of formula (27) with a metal amide base such as sodium bis(trimethylsilyl)amide in a solvent such as an ether, e.g. a cyclic ether such as tetrahydrofuran at a temperature of around  $0^\circ C$  and then adding di-*tert*-butyl dicarbonate in a solvent such as tetrahydrofuran and stirring at ambient temperature. A compound of formula (1) can then be prepared by the following reaction sequence. A compound of formula (28) is treated with a base such as an alkyl lithium, e.g. *n*-butyl lithium in a solvent such as an ether e.g. a cyclic ether such as tetrahydrofuran at a temperature of around  $-78^\circ C$ . Sulfur dioxide gas is bubbled through the reaction mixture before allowing the reaction to warm to room temperature. Solvents are removed *in vacuo* and the crude material dissolved in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane and the mixture treated with a chlorinating reagent such as *N*-chlorosuccinimide at around ambient temperature. An amine of formula  $HNR^{16}R^{16}$  or ammonia can then be added to the reaction mixture to produce a compound of formula (29), where  $R = t$ -butoxycarbonyl. A sulphonamide of formula (1) can then be prepared by

- treating a compound of formula (29) with an acid e.g. a mineral acid such as HCl or an organic acid such as trifluoroacetic acid in a solvent such as a halogenated hydrocarbon e.g. dichloromethane. Intermediates of formula (27) may be obtained by decarboxylation of compounds of formula (17) with an acid such as a mineral acid e.g. HCl in a solvent such as an ether e.g. a cyclic ether e.g. tetrahydrofuran or 1,4-dioxane at a temperature from 50°C up to the reflux temperature.

- 10 Compounds of formula (1) in which A is a -N= atom may be obtained using the synthetic routes in Schemes (1) and (2) with a pyrimidine starting material of formula (12):

- wherein Hal is a halogen atom such as a chlorine atom and LG is a halogen such as chlorine or group such as a methylsulfanyl or methylsulfonyl. Compound (30) and analogues, where LG is a methylsulfanyl group, are known [Santilli et al, J. Heterocycl. Chem. 8, 445-453 (1971)]. A compound of formula (30) can undergo a reaction such as the Sandmeyer reaction as described for compounds of formula (7) to afford a bromide of formula (31).
- 20 In subsequent steps the methylsulfanyl group or other leaving group LG present in compounds such as (31) may be hydrolysed using a base such as sodium or potassium hydroxide in a solvent such as an alcohol e.g. methanol or ethanol at an elevated temperature, e.g. the reflux temperature. Alternatively, the LG group may first be converted to an ether by reaction with an alkoxide such as sodium methoxide or sodium phenyl methanolate in a solvent, e.g. an alcohol such as methanol or ethanol at a temperature between 0°C and the reflux, and the ether then cleaved using standard procedures such as by reduction with hydrogen gas in the presence of a catalyst such as a palladium catalyst, e.g. palladium on charcoal, or where

the ether is an alkyl ether, by reaction with a trialkylsilyl halide such as trimethylsilyl chloride, in the presence of an inorganic halide such as sodium iodide in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane or in a nitrile e.g. acetonitrile. This will reveal the pyrimidinone functionality  
5 which can be either alkylated or arylated as described for compounds of formula (4) and can be converted to compounds of formula (1) as previously described.

Compounds of the invention and intermediates thereto where A represents a  
10  $-N(R^b)-$  or  $-C(R^b)(R^c)-$  group may be generated from corresponding compounds of the invention or intermediates thereto where A represents a  $-N=$  or  $-C(R^b)=$  group by reduction, for instance by catalytic hydrogenation using a metal catalyst such as palladium on charcoal in the presence of hydrogen gas at an elevated pressure in a solvent such as an alcohol, e.g.  
15 ethanol optionally at an elevated temperature e.g. between 40°C and 60°C.

Where in the general processes described above intermediates such as alkylating agents of formula  $Cy^1L^1(Alk^1)_nZ$ , reagents of formula  $HXCH_2CO_2Et$  and any other intermediates required in the synthesis of compounds of the  
20 invention are not available commercially or known in the literature, they may be readily obtained from simpler known compounds by one or more standard synthetic methods employing substitution, oxidation, reduction or cleavage reactions. Particular substitution approaches include conventional alkylation, arylation, heteroarylation, acylation, thioacylation, halogenation,  
25 sulphonylation, nitration, formylation and coupling procedures. It will be appreciated that these methods may also be used to obtain or modify other intermediates and in particular compounds of formula (1) where appropriate functional groups exist in these compounds. Particular examples of such methods are given in the Examples hereinafter.

30

Thus for example aromatic halogen substituents in the compounds may be subjected to halogen-metal exchange with a base, for example a lithium base such as n-butyl or t-butyl lithium, optionally at a low temperature, e.g. around -78°C, in a solvent such as tetrahydrofuran and then quenched with an electrophile to introduce a desired substituent. Thus, for example, a formyl group may be introduced by using dimethylformamide as the electrophile, a thiomethyl group may be introduced by using dimethyldisulphide as the electrophile, an alcohol group may be introduced by using an aldehyde as electrophile and an acid may be introduced by using carbon dioxide as electrophile. Aromatic acids of formula  $\text{ArCO}_2\text{H}$  may also be generated by quenching Grignard reagents of formula  $\text{ArMgHal}$  with carbon dioxide.

Aromatic acids of formula  $\text{ArCO}_2\text{H}$  generated by this method and acid containing compounds in general may be converted to activated derivatives, e.g. acid halides by reaction with a halogenating agent such as a thionyl halide e.g. thionyl chloride, a phosphorous trihalide such as phosphorous trichloride or a phosphorous pentahalide such as phosphorous pentachloride optionally in an inert solvent such as an aromatic hydrocarbon e.g. toluene or a chlorinated hydrocarbon e.g. dichloromethane at a temperature from about 0°C to the reflux temperature, or may be converted into Weinreb amides of formula  $\text{ArC(O)N(OMe)Me}$  by conversion to the acid halide as just described and subsequent reaction with an amine of formula  $\text{HN(OMe)Me}$  or a salt thereof, optionally in the presence of a base such as an organic amine, e.g. triethylamine in an inert solvent such as an aromatic hydrocarbon e.g. toluene or a chlorinated hydrocarbon e.g. dichloromethane at a temperature from about 0°C to ambient temperature.

Compounds of the invention and intermediates thereto may be prepared by alkylation, arylation or heteroarylation. For example, compounds containing a  $-\text{L}^1\text{H}$  group (where  $\text{L}^1$  is a linker atom or group) may be treated with an alkylating agent  $\text{Cy}^1\text{Z}^2$  in which  $\text{Z}^2$  is a leaving atom or group such as a

halogen atom, e.g. a fluorine, chlorine, bromine or iodine atom or a sulphonyloxy group such as an alkylsulphonyloxy, e.g. trifluoromethylsulphonyloxy or arylsulphonyloxy, e.g. p-toluenesulphonyloxy group.

5

The reaction may be carried out in the presence of a base such as a carbonate, e.g. caesium or potassium carbonate, an alkoxide, e.g. potassium t-butoxide, or a hydride, e.g. sodium hydride, in a dipolar aprotic solvent such as an amide, e.g. a substituted amide such as dimethylformamide or an  
10 ether, e.g. a cyclic ether such as tetrahydrofuran.

In another example, compounds containing a  $-L^2H$  group as defined above may be functionalised by acylation or thioacylation, for example by reaction with the alkylating agents just described but in which  $Z^2$  is replaced by a -  
15  $C(O)Z^3$ ,  $C(S)Z^3$ ,  $-N(R^2)COZ^3$  or  $-N(R^2)C(S)Z^3$  group in which  $Z^3$  is a leaving atom or group as described for  $Z^2$ . The reaction may be performed in the presence of a base, such as a hydride, e.g. sodium hydride or an amine, e.g. triethylamine or N-methylmorpholine, in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane or carbon tetrachloride or an amide, e.g.  
20 dimethylformamide, at for example ambient temperature. Alternatively, the acylation may be carried out under the same conditions with an acid (for example one of the alkylating agents described above in which  $Z^2$  is replaced by a  $-CO_2H$  group) in the presence of a condensing agent, for example a diimide such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide or N,N'-  
25 dicyclohexylcarbodiimide, or a benzotriazole such as [O-(7-azabenzotriazol-1-yl)-1,1,3,3-tetramethyluronium]hexafluorophosphate advantageously in the presence of a catalyst such as a N-hydroxy compound e.g. a N-hydroxytriazole such as 1-hydroxybenzotriazole. Alternatively the acid may  
30 be reacted with a chloroformate, for example ethylchloroformate, prior to the desired acylation reaction

In a further example compounds may be obtained by sulphonylation of a compound containing an -OH group by reaction with one of the above alkylating agents but in which  $Z^2$  is replaced by a -S(O)Hal or -SO<sub>2</sub>Hal group [in which Hal is a halogen atom such as chlorine atom] in the presence of a  
5 base, for example an inorganic base such as sodium hydride in a solvent such as an amide, e.g. a substituted amide such as dimethylformamide at for example ambient temperature.

In another example, compounds containing a -L<sup>2</sup>H group as defined above  
10 may be coupled with one of the alkylation agents just described but in which  $Z^2$  is replaced by an -OH group in a solvent such as tetrahydrofuran in the presence of a phosphine, e.g. triphenylphosphine and an activator such as diethyl, diisopropyl- or dimethylazodicarboxylate.

15 Ester groups such as -CO<sub>2</sub>Alk<sup>6</sup> and -CO<sub>2</sub>R<sup>4</sup> in the compound of formula (1) and intermediates thereto may be converted to the corresponding acid [-CO<sub>2</sub>H] by acid- or base-catalysed hydrolysis depending on the nature of the group Alk<sup>6</sup> or R<sup>4</sup>. Acid- or base-catalysed hydrolysis may be achieved for example by treatment with an organic or inorganic acid, e.g. trifluoroacetic  
20 acid in an organic solvent e.g. dichloromethane or a mineral acid such as hydrochloric acid in a solvent such as dioxan or an alkali metal hydroxide, e.g. lithium hydroxide in an aqueous alcohol, e.g. aqueous methanol.

In a further example, -OR<sup>6</sup> [where R<sup>6</sup> represents an alkyl group such as  
25 methyl group] in compounds of formula (1) and intermediates thereto may be cleaved to the corresponding alcohol -OH by reaction with boron tribromide in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane at a low temperature, e.g. around -78°C.

30 Alcohol [-OH] groups may also be obtained by hydrogenation of a corresponding -OCH<sub>2</sub>R<sup>31</sup> group (where R<sup>31</sup> is an aryl group) using a metal

catalyst, for example palladium on a support such as carbon in a solvent such as ethanol in the presence of ammonium formate, cyclohexadiene or hydrogen, from around ambient to the reflux temperature. In another example, -OH groups may be generated from the corresponding ester [e.g. -  
5 CO<sub>2</sub>Alk<sup>6</sup>] or aldehyde [-CHO] by reduction, using for example a complex metal hydride such as lithium aluminium hydride or sodium borohydride in a solvent such as methanol.

In another example, alcohol -OH groups in the compounds may be converted  
10 to a corresponding -OR<sup>6</sup> group by coupling with a reagent R<sup>6</sup>OH in a solvent such as tetrahydrofuran in the presence of a phosphine, e.g. triphenylphosphine and an activator such as diethyl-, diisopropyl-, or dimethylazodicarboxylate.

15 Aminosulphonylamino [-NHSO<sub>2</sub>NH<sub>2</sub>] groups in the compounds may be obtained, in another example, by reaction of a corresponding amine [-NH<sub>2</sub>] with sulphamide in the presence of an organic base such as pyridine at an elevated temperature, e.g. the reflux temperature.

20 In another example compounds containing a -NHCSR<sup>7</sup> or -CSNHR<sup>7</sup> group may be prepared by treating a corresponding compound containing a -NHCOR<sup>7</sup> or -CONHR<sup>7</sup> group with a thiation reagent, such as Lawesson's Reagent or P<sub>2</sub>S<sub>5</sub>, in an anhydrous solvent, for example a cyclic ether such as tetrahydrofuran, at an elevated temperature such as the reflux temperature.

25

In a further example amine (-NH<sub>2</sub>) groups may be alkylated using a reductive alkylation process employing an aldehyde and a reducing agent. Suitable reducing agents include borohydrides for example sodium triacetoxyborohydride or sodium cyanoborohydride. The reduction may be  
30 carried out in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane, a ketone such as acetone, or an alcohol, e.g. ethanol,

where necessary in the presence of an acid such as acetic acid at around ambient temperature. Alternatively, the amine and aldehyde may be initially reacted in a solvent such as an aromatic hydrocarbon e.g. toluene and then subjected to hydrogenation in the presence of a metal catalyst, for example  
5 palladium on a support such as carbon, in a solvent such as an alcohol, e.g. ethanol.

In a further example, amine [-NH<sub>2</sub>] groups in compounds of formula (1) and intermediates thereto may be obtained by hydrolysis from a corresponding  
10 imide by reaction with hydrazine in a solvent such as an alcohol, e.g. ethanol at ambient temperature.

In another example, a nitro [-NO<sub>2</sub>] group may be reduced to an amine [-NH<sub>2</sub>], for example by catalytic hydrogenation using for example hydrogen in the  
15 presence of a metal catalyst, for example palladium on a support such as carbon in a solvent such as an ether, e.g. tetrahydrofuran or an alcohol e.g. methanol, or by chemical reduction using for example a metal, e.g. tin or iron, in the presence of an acid such as hydrochloric acid.

20 In a further example amine (-CH<sub>2</sub>NH<sub>2</sub>) groups in compounds of formula (1) and intermediates thereto may be obtained by reduction of nitriles (-CN), for example by catalytic hydrogenation using for example hydrogen in the presence of a metal catalyst, for example palladium on a support such as carbon, or Raney<sup>®</sup> nickel, in a solvent such as an ether e.g. a cyclic ether  
25 such as tetrahydrofuran or an alcohol e.g. methanol or ethanol, optionally in the presence of ammonia solution at a temperature from ambient to the reflux temperature, or by chemical reduction using for example a metal hydride e.g. lithium aluminium hydride, in a solvent such as an ether e.g. a cyclic ether such as tetrahydrofuran, at a temperature from 0°C to the reflux temperature.

30

In another example, sulphur atoms in the compounds, for example when present in a group L<sup>1</sup> or L<sup>2</sup> may be oxidised to the corresponding sulfoxide or sulphone using an oxidising agent such as a peroxy acid, e.g. 3-chloroperoxybenzoic acid, in an inert solvent such as a halogenated  
5 hydrocarbon, e.g. dichloromethane, at around ambient temperature.

In a further example N-oxides of compounds of formula (1) may in general be prepared for example by oxidation of the corresponding nitrogen base as described above in relation to the preparation of intermediates of formula (5).  
10

Salts of compounds of formula (1) may be prepared by reaction of compounds of formula (1) with an appropriate base in a suitable solvent or mixture of solvents e.g. an organic solvent such as an ether e.g. diethylether,  
15 or an alcohol, e.g. ethanol using conventional procedures.

Where it is desired to obtain a particular enantiomer of a compound of formula (1) this may be produced from a corresponding mixture of enantiomers using any suitable conventional procedure for resolving  
20 enantiomers.

Thus for example diastereomeric derivatives, e.g. salts, may be produced by reaction of a mixture of enantiomers of formula (1) e.g. a racemate, and an appropriate chiral compound, e.g. a chiral base. The diastereomers may then  
25 be separated by any convenient means, for example by crystallisation and the desired enantiomer recovered, e.g. by treatment with an acid in the instance where the diastereomer is a salt.

In another resolution process a racemate of formula (1) may be separated  
30 using chiral High Performance Liquid Chromatography. Alternatively, if desired a particular enantiomer may be obtained by using an appropriate

chiral intermediate in one of the processes described above. Alternatively, a particular enantiomer may be obtained by performing an enantiomer specific enzymatic biotransformation e.g. an ester hydrolysis using an esterase and then purifying only the enantiomerically pure hydrolysed acid from the unreacted ester antipode.

Chromatography, recrystallisation and other conventional separation procedures may also be used with intermediates or final products where it is desired to obtain a particular geometric isomer of the invention.

**Preparation of activated human p38 $\alpha$  for inhibitor assays.****Purification of human p38 $\alpha$** 

Human p38 $\alpha$ , incorporating an N-terminal (His)6 tag, was expressed in  
5 baculovirus-infected High-Five™ cells (Invitrogen) according to the  
manufacturers instructions. The cells were harvested 72h post-infection and  
lysed in phosphate buffered saline (PBS) containing 1% (w/v)  $\beta$ -  
octylglucoside and Complete, EDTA-free™ protease inhibitors (Roche  
Molecular Biochemicals). The lysate was centrifuged at 35000xg for 30min at  
10 4°C and the supernatant applied to a NiNTA™ column (Qiagen). Bound  
protein was eluted by 150mM imidazole in PBS (after a wash with 15mM  
imidazole in PBS) and directly applied to a HiTrap Q™ column (AP Biotech).  
Bound protein was eluted using a 20 column volume, 0 to 1M NaCl gradient.  
Fractions containing (His)6-p38 were aliquotted and stored at -70° prior to  
15 their activation.

**Preparation of GST-MKK6EE-containing lysates**

E. coli (BL21 pLysS) expressing the constitutively activated form of human  
MKK6 fused with an N-terminal glutathione-S-transferase tag (GST-  
20 MKK6EE) were harvested by centrifugation and frozen at -70°. Cells were  
lysed by resuspension in 1/10th the culture volume of PBS containing  
Complete, EDTA-free™ protease inhibitors followed by sonication on ice for  
4x15 sec. Cell debris was removed by centrifugation at 35,000xg and the  
resultant supernatant stored in aliquots at -70°.

25

**Activation of (His)6-p38**

0.45mL of purified (His)6-p38 was incubated with 50 $\mu$ L of the GST-MKK6EE-  
containing lysate for 30min at 23° in the presence of 1mM  $\beta$ -  
glycerophosphate, 10mM MgCl<sub>2</sub> and 9mM ATP. The extent of activation was  
30 monitored by mass spectrometric detection of the doubly-phosphorylated  
form of (His)6-p38, which routinely comprised greater than 90% of the final

(His)6-p38 preparation. The activated (His)6-p38 was then diluted x10 in PBS and repurified using the method described above. The concentration of purified, activated (His)6-p38 was measured by UV absorbance at 280nm using  $A_{280} \cdot 0.1\% = 1.2$  and the preparation stored in aliquots at  $-70^\circ$  prior to its use in inhibitor assays.

### **p38 Inhibition Assays**

#### **Inhibition of phosphorylation of biotinylated myelin basic protein (MBP)**

The inhibition of p38 catalysed phosphorylation of biotinylated MBP is measured using a DELFIA based format. The assay was performed in a buffer comprising, 20mM HEPES (pH 7.4), 5mM  $MgCl_2$  and 3mM DTT. For a typical  $IC_{50}$  determination, biotinylated MBP (2.5 $\mu$ M) was incubated at room temperature in a streptavidin-coated microtitre plate together with activated gst-p38 (10nM) and ATP (1 $\mu$ M) in the presence of a range of inhibitor concentrations (final concentration of DMSO is 2 percent). After fifteen minutes the reaction was terminated by the addition of EDTA (75mM). The microtitre plate was then washed with Tris buffered saline (TBS), prior to the addition of 100 $\mu$ l of anti-phospho MBP antibody (mouse) together with europium-labeled anti-mouse IgG antibody. After one hour at room temperature the plate was again washed in TBS followed by the addition of Enhancement solution (PerkinElmer Wallac). Fluorescence measurements were performed after a further fifteen minutes at room temperature.

$IC_{50}$  values are determined from the plot of  $\log_{10}$  inhibitor concentration (x-axis) versus percentage inhibition of the fluorescence generated by a control sample in the absence of inhibitor (y-axis).

#### **Purification of human Peripheral Blood Mononuclear Cells**

Peripheral blood mononuclear cells (PBMC) were isolated from normal healthy volunteers. Whole blood was taken by venous puncture using heparinised vacutainers (Becton Dickinson), diluted 1 in 4 in RPMI 1640 (Gibco, UK) and centrifuged at 400g for 35 min over a Ficoll-paque gradient

(Amersham-Pharmacia Biotech, UK). Cells at the interface were removed and washed once followed by a low speed spin (250g) to remove platelets. Cells were then resuspended in DMEM containing 10% FCS, penicillin 100 units ml<sup>-1</sup>, streptomycin 50µg ml<sup>-1</sup> and glutamine 2mM (Gibco, UK).

5

#### **Inhibitor dilutions**

Inhibitor stocks (20mM) were kept as a frozen solution (-20°C) in DMSO. Serial dilutions of inhibitors were performed in DMSO as 250-times concentrated stocks. Inhibitors were diluted 1 in 250 into tissue culture media, prewarmed to 37°C and transferred to plates containing PBMC. PBMC and inhibitors were incubated together for 30 mins prior to addition of LPS. Inhibitors used in whole blood assays were prepared according to a different regime. Using the same stock solution serial dilutions of inhibitors were performed in DMSO. Inhibitors were then diluted 1 in 500 straight into whole blood in a volume of 1µL. Inhibitor was incubated with whole blood for 30 mins prior to the addition of LPS.

10

#### **LPS stimulation of PBMC**

PBMC were resuspended at a density of 2x10<sup>5</sup> cells/well in flat bottomed 96 well tissue culture treated plates. After the addition of inhibitor cells were stimulated with an optimal dose of LPS (*E coli* strain B5:055, Sigma, at a final concentration of 1µg ml<sup>-1</sup>) and incubated at 37°C in 5%CO<sub>2</sub>/95% air for 18 hours. TNF-α levels were measured from cell free supernatants by sandwich ELISA (BioSource #CHC1751).

20

#### **LPS stimulation of whole blood**

Whole blood was taken by venous puncture using heparinised vacutainers (Becton Dickinson), and 500µl of blood aliquoted into each well of a 24 well tissue culture treated plate. After the addition of inhibitor cells were stimulated with an optimal dose of LPS (*E coli* strain B5:055, Sigma, at a final

25

concentration of  $1\mu\text{g ml}^{-1}$ ) and incubated at  $37^{\circ}\text{C}$  without  $\text{CO}_2$  for 18 hours. TNF- $\alpha$  levels were measured from cell free supernatants by sandwich ELISA (BioSource #CHC1751).

**5 Rat LPS induced TNF release**

Male Lewis rats (180-200g) are anaesthetised with Isofluror and injected i.v. with LPS\* in a volume of 0.5ml sterile saline. After 90minutes blood is collected into EDTA tubes for preparation of plasma samples. Plasma is stored at  $-70^{\circ}\text{C}$  prior to assay for TNF $\alpha$  by commercial ELISA.

10

**Rat CIA**

Female Lewis rats (180-200g) are anaesthetised with Isofluror and immunised i.d. at the base of the tail with  $2 \times 100\mu\text{l}$  of emulsion containing 4mg/ml bovine collagen II in 0.01M acetic acid and Freund's Incomplete Adjuvant at a ratio of 1:1. A polyarthritis develops with onset from about 13 days post sensitisation. The disease is mainly confined to the ankles and is quantified by plethysmometry. Results are expressed as change in paw volume over time.

15

20 In the p38 inhibitor assays described above compounds of the invention have  $\text{IC}_{50}$  values of around  $1\mu\text{M}$  and below. The compounds of the invention are clearly potent inhibitors of p38 kinase, especially p38 $\alpha$  kinase.
